Date	

How this activity works

- Work in groups of 3–4. Type your answers directly into the boxes.
- There is no single right answer. What matters is that you can explain each choice.
- **Suggested time:** Part A 10 min · Part B 10 min · Part C 15 min · Part D 15 min · Part E 10 min. Your lecturer may adjust this.
- Use the lecture slides to check a term. Rows shaded in green are worked examples.

The scenario (fictional)

The University of Petra plans to launch Petra Study Buddy, a chatbot built on a large language model (LLM) bought from an outside vendor. Students can ask it about course registration, exam dates, library hours and study tips, and it can also suggest which courses to take next semester.

What we know

- It was trained by the vendor on public web text. The university adds its own course catalogue and past registration records.
- Answers are generated in the moment, so the same question can get slightly different answers.
- It runs on the vendor's cloud. Student chats are stored there for 90 days.
- In a small pilot, it once gave a wrong exam date, and it recommended fewer advanced courses to students from some departments.

Part A · Is it AI?

Normal software follows fixed rules. AI learns patterns from data. Decide which of these systems are AI-based, and say why.

System	AI or normal?	Why? (learning, rules, data…)
Example: a calculator app	**Normal**	Fixed rules written by developers. It never learns and always gives the same answer.
A library system that blocks a book loan after 3 overdue items		
A tool that groups students into study-style types without being given the groups		
Petra Study Buddy answering a question about exam dates		
An email filter that gets better at spotting spam as users mark mistakes		
A timetable app that shows classes by room number		

Part B · Data, algorithm and model

Every AI system has three building blocks. Describe each for Petra Study Buddy, and name one thing that could go wrong there.

Building block	What is it in Study Buddy?	What could go wrong here?
Example: Data	Past registration records and the course catalogue	Records may reflect old patterns, so some departments are steered away from advanced courses.
Data	Another data source: _____	
Algorithm		
Model		

Hint: remember the LLM-specific risks, such as hallucinations, prompt attacks and data leakage.

Part C · Who does what?

Match each task to the role that should own it, and add one thing that role should decide or check.

Task	Best role to own it	What should they decide or check?
Example: approve the chatbot for launch	AI governance committee	Whether the risks are acceptable and a human can review wrong answers.
Define what the chatbot is for and answer for its impact		
Test it and watch for wrong answers or bias		
Check privacy law and the vendor contract		
Protect stored chats and control who has access		
Independently check that all of this really happens		

Roles to choose from: Board and senior management · AI governance committee · Business or use-case owner · Data science and technical team · Risk management · Legal and compliance · Information security and privacy · Internal audit.

Part D · Principles check

Choose six of the twelve Responsible AI principles. For each one, write one practice that would make Study Buddy follow it.

> **The twelve principles:** accountability · fairness and non-discrimination · transparency · explainability · privacy and data protection · security and resilience · safety and reliability · human oversight · risk-based approach · ethical and responsible use · continuous monitoring · compliance with laws and standards.

Principle	A practice for Study Buddy
Example: Accountability	Name one business owner, the Dean of Student Affairs, who answers for what the chatbot says and who handles complaints.

Part E · Mini policy and one KPI

Write five “We will…” statements that could become the start of a Petra Study Buddy policy. Then choose one KPI to show whether governance is working.

#	We will...
Ex.	We will send every answer about exam dates, fees or deadlines with a link to the official source.
1	
2	
3	
4	
5	

KPI	Your answer
What will we measure?	
Target (a number and a unit)	
Who reports it, and how often?	

This scenario is fictional and is not based on any real university system.
